For another course in my Information Technology major that I felt really helped me learn a lot about it within a certain specific area from an assignment, that would be IT-1100-1 Foundations of Hardware where the assignment was a part of the final exam that involved building and designing a virtual dream computer from that of the motherboard up in a powerpoint presentation.

When it comes to how I did this assignment, that would be that the dream computer I chose to research and build virtually with creating a powerpoint slide on was a Dell Desktop Computer where I went on to talk about its specified purpose with what I would specifically want it to be able to do and what I will use it for as well. From there, I then listed all of the different components that I would need for my specific computer with the kind of Motherboard, Desktop Computer Case, Memory, Hard Drive, Processor, Desktop Computer Monitor, Keyboard, Mouse, Graphics Card, and Sound Card with listing the various different factors about each one with that of what its purpose would be for my computer, its description, and also why I chose it as well. Lastly, I then went on and talked about the specific Operating System that I would need with reasons and cost and also the Software Applications that I would need as well.

For what I ended up learning from this assignment, that would be how to research and build a dream computer virtually in a certain way.
